

MORE WATER DOES NOT MEAN BETTER CLEANING

All HE top load washers are designed to use the right amount of water based on the cycle selected and the load being washed. With tough particles that won't dissolve in water, the Deep Fill option presents customers with extra rinsing power to flush out debris during spin and rinse.

AUTO SENSING

Sensors in the washer determine the load size and, along with the cycle choice made, will add the optimal amount of water to get the best clean.

DETERGENT CONCENTRATION

High-efficiency detergent effectively cleans with both deep and low water levels.

ROLLOVER WASH ACTION

Agitators and impellers both use friction between fabrics to clean clothes in deep and low water levels.

WHEN SHOULD THE CUSTOMER SELECT DEEP FILL?

Select Deep Fill when you need to loosen those heavy soiled items, like grass or hair, that don't dissolve in water. For normal stains and dissolvable soils, however, the regular cycle will give customers clean laundry with lower water washes.
